These notes apply to all drawings unless otherwise shown or noted. All dimensions shall be verified by the Contractors before starting

Details and dimensions of existing construction shall be verified at the site by the contractor. Features of construction shown are typical, and they shall apply generally for all similar conditions. Soils report for this project was prepared by:

Contractor shall make himself familiar with the Soil Report and satisfy all requirements and follow all recommendations stated therein.

Engineer - ALLIED ENGINEERS, INC. designated representative.

Design Criteria Applicable Code 1987 UBC For precast concrete, see Sheet No. Cast-in-place concrete F'c=4,000 psi • 28 days Reinforcing, grade 60-ASTM-A615 Welded wire fabric (WWF) ASTM-A185 Fv=60.000 psi Fy=70,000 psi Soil bearing pressure Soil Concrete unit weight 150 psf

Wind load less than 30° 13.52 psf of projected area

Deck live load 50 psf Roof live load 16 psf Seismic load Zone 4

Concrete Notes Cast-in-place concrete

hardrock concrete.

1. Applicable Specifications a) 1987 UBC requirements for reinforced concrete.

### 2. Materials

a) Portland cement: Shall conform to ASTM designations C150 for Type Il cement, use single approved standard brand thoughout work. b) Concrete aggregates: Shall conform to ASTM designation C33 for

c) Water: Shall be clean and free from deleterious amounts of acid, alkalis or organic materials.

d) Curing compounds: Shall conform to the requirements of ASTM C309. e) Non-shrink arout: Shall be pre-mixed, high strength, flowable grout

which does not shrink as it cures. Reinforcing Steel Bars: Shall conform to ASTM A615 Grade 60.

Welded wire fabric: Shall conform to ASTM A497. n) Bar Support: Shall conform to CRSI Manual of Standard Practice and shall be Class A.

i) Ties: Shall be of black annealed wire, gauge 16 or heavier.

a) Proportioning of ingredients shall conform to ACI 211, subject to the following:

b) Maximum water—cement ratio to be 0.45. c) Minimum cement contents as follows: Course Aggregate No. 467 (1-1/2 in. maximum)

57 (1 in. maximum) or 67 (3/4 in. maximum) 564

d) Air content Air content (as determined in accordance with ASTM C231 or C173

5- 1 percent for coarse aggregate size No. 467. 6- 1 percent for coarse aggregate size No. 57 or No. 67.

Slump (as determined in accordance with ASTM C231 or C173) shall be: 1 in, minimum.

3 in. maximum for footings, caissons, substructure walls. 4 in. maximum for slabs, beams reinforced walls, columns.

### 4. Workmanship a) Formwork

1) Construction of forms The forms shall be smooth, mortar—tight, true to the required lines and grade, and of sufficient strength to resist springing out of shape during the placing and vibrating of concrete. All dirt, chips, sawdust, and other foreign matter shall be completely removed before concrete is placed. Forms previously used shall be thoroughly cleaned of all dirt, mortar, and foreign matter before being used. Before concrete or rebar is placed in forms, all inside surfaces of the forms shall be thoroughly coated with an approved form sealer. The form sealer shall be of high penetrating quality leaving no film on the surface of the forms that can be absorbed by the concrete or be incompatible with concrete paint.

2) Stripping of forms a) Forms shall be removed in such manner as to insure the complete safety of the structure.

b) Formwork for beam soffits and slabs and other parts that support the weight of concrete, shall remain in place until the concrete has reached it's specified 28—day strength, with a minimum of 14 days elapsed before form

b) Reinforcing Steel 1) Fabrication: Shall be in accordance with the details shown on drawings. Details and fabrication of reinforcing steel not specifically shown shall be similar to details shown on drawings.

2) Bending of all reinforcing bars shall conform to typical bend details on the drawings and shall be accomplished without heating of the bars and by method which does not injure the reinforcement. No field bending will be permitted without engineers permission.

3) Steel reinforcement shall be accurately placed and shall be supported and secured against displacement by the use of adequate and proper supporting and spacing devices, tie wires, etc., so that it will remain in its correct location in the finished work. No supporting devices shall be used that will impede the flow of concrete.

4) Where not shown otherwise on the plans, the minimum concrete coverage for steel reinforcement shall be as follows: Where concrete is deposited against ground 3". Concrete in forms exposed to earth 1-1/2".

The clear spacing between parallel bars shall not be less than 1-1/2 times the nominal diameter of the maximum size aggregate. and in no case less than 1-1/2 inches, except at splices which may be wired together.

1) All cement used in preparation of concrete shall be Type II ASTM C150 Specifications. All concrete shall have minimum 28

day compressive strength of: 4.000 psi. 2) All concrete shall be placed, finished and cured, and all other pertinent construction practices shall be in accordance with

the Specifications for Structural Concrete for Buildings (ACI—301—72), hereby made a part of these specifications. 3) In addition to the requirements of ACI 301-72, the following shall maintain: Concrete shall be placed so that:

b) The concrete will be free of all rock pockets, honeycombs

and voids. c) Deposit as nearly as practical in its final position. d) Deposit in walls in approximately 18 inch layers,

a) A uniform appearance of surfaces will be obtained

proceeding at a uniform rate. 4) Do not deposit or place concrete until all forms, reinforcing steel, embedded materials and construction joints have been inspected by the engineer and accepted in advance within the entire extent of the pour.

5) The subgrade must be moist when the concrete is placed for floor slabs to prevent excessive loss of water from the concrete mix.

6) Employ as many vibrators and tampers as necessary to insure the desired results. Minimum: One per each 20 cubic yards of concrete placed per hour. Vibrators shall function a minimum frequency of 3600 cycles per minute when submerged in concrete. Supplement by forking and spading along the surfaces of the forms and between reinforcing whenever flow is restricted.

7) Eliminate the following practices: a) Pushing of concrete with vibrator. External vibration of forms.

c) Allowing vibrator to vibrate against reinforcing steel where steel projects into green concrete. d) Allowing vibrator to vibrate contact faces on forms. 8) Slab Finishing Tolerance Class A 1/8" in 10'.

d) Curing
1) General: Freshly deposited concrete shall be protected from premature drying and excessively hot or cold temperatures and shall be maintained with minimal moisture loss at a relatively constant temperature for the period of time necessary for the hydration of the cement and proper hardening of the concrete.

2) Initial curing: Initial curing shall immediately follow the finishing operation. Concrete shall be kept continuously moist at least overnight. One of the following materials or methods shall be used:

.Ponding or continuous sprinkling. .Absorptive mat or fabric kept continuously wet. Waterproof paper conform to ASTM C171. .Curing compounds conforming to "Specifications for Liquid Membrane Forming Compounds for Curing Concrete" ASTM C309. Such compounds shall be applied in accordance with the recommendations of the manufacturer and shall not be used on any surfaces against which additional concrete or other cementitious finishing materials are to be bonded, nor on surfaces on which curing is prohibited by the project

3) Final Curing: Immediately following the initial curing and before the concrete has dried, additional curing shall be accomplished by one of the following methods: .Continuing the method used in initial curing. Waterproof paper conforming to Specifications for Waterproof Paper for Curing Concrete (ASTM C171).

4) Duration of Curing: The final curing shall continue until the cumulative number of days or fractions thereof, not necessarily consecutive during which temperature of the air in contact with the concrete is above 50F, has totaled 7 days. If high-early strength concrete has been used, the final curing shall continue for a total of 3 days. Rapid drying at the end of the curing period shall be prevented.

5) Form surfaces: Steel forms heated by the sun and all wood forms in contact with the concrete during the final curing period shall be kept wet. If forms are to be removed during the curing period, one of the above curing materials or methods shall be employed immediately. Such curing shall be continued for the remainder of the curing period.

### e) Construction Joints

specifications.

1) Joints not shown on the drawing shall be so made and located as to least impair the strength of the structural element and shall be approved by the Engineers. Concrete for foundation between construction joints shall be placed in one continuous

2) The surfaces of all concrete at all joints shall be thoroughly cleaned and all laitance removed by sand blasting. In preparation for the next pour, the joints shall be dampened. thoroughly, without leaving standing water.

### f) Imbedded Items

1) All sleeves, inserts, anchors, and imbedded items required for adjoining work or for its support shall be placed prior to concreting. Imbedded items shall be positioned accurately and supported against displacement. Voids in sleeves, inserts and anchor bolt slots shall be filled temporarily with a readily removable material to prevent entry of concrete into the voids.

2) All anchor bolts, nuts and washers in Aerobic Reactors and Chlorine contact shall be stainless steel.

## g) Grouting Column Bases

1) The arout shall be mixed and placed in strict accordance with manufacturer's instructions.

2) Care shall be taken in the grouting to insure that there are no voids or air pockets, and that there is full bearing between the base plates and the grout.

1) Within 3 (three) days after stripping formwork, all surface defects such as rock pockets, honeycombs, foreign materials, cracks and form tie holes shall be filled and patched as required by the Engineer.

2) Areas to be patched shall have all loose material removed and shall be thoroughly wetted for at least 6 inches entirely surrounding the patch. Patching shall be prepared which shall consist of 1 part cement and 3 parts sand. Water in the mix shall be kept to a minimum. Grout shall not be retempered by adding water. Grout shall be compacted thoroughly into place using hammer with flat ended tool or other method approved by the Engineer and screeded to match adjacent surfaces in texture and pattern.

3) Form tie hole shall be filled solidly with grout. For holes passing entirely through walls, a plunger type "grease gun other suitable device shall be used to completely grout fill i) Concrete Testing All concrete must meet the called out requirements for a minimum 28 day compressive strength. All concrete cylinders will be molded and tested for strength by a representative of the owner. Four cylinders for each test set shall be molded. Two shall be tested at seven (7) days and two at twenty eight (28) days. The contractor will furnish all concrete required for molding of the cylinders and in cases where cylinders are stored at the site, place shall be provided for their protection.

i) Defective Concrete All defective concrete shall be subject to removal and replacement by the contractor at his expense.

### Carpentry Notes

1) Applicable Specifications
a) 1987 UBC

2) Materials

a) Framing Lumber No. 1 D.F Studs Rafters No. 2 D.F. Columns No. 1 D.F Headers No. 1 D.F Joist No. 1 D.F. No. 2 D.F. Blocking No. 1 D.F. Beams

b) Plywood Structural | EXT-APA (appearance as required)

c) Wood Sills No. 1 D.F. Pressure treated in conformance with AWPB CP-2.

d) Building Paper 15 lb/100 S.F. Asphalt Saturated in conformance with ASTM

e) Hardware Bolts and Nuts Lag Bolts Washers Nails Connectors

Power driven fasteners

ASTM A-307 galvanized FF-B-56 galvanized Malleable iron-galvanized FF-N-105 common adjustized KC "Superspeed" Simpson "Strong Tie" — galvanized or epoxy coated. Subject to prior approval of the

### 3) Workmanship a) Silis

Sills shall be minimum 3" thick © structural plywood sheathed nailed and 2" thick elsewhere. Sills shall be anchored with minimum 5/8 x 9" bolts spaced not over 48" o/c. There shall be minimum of 2 bolts in each stick with a bolt within 9" of each end of each stick and 9" from each side of posts 6 x 8 and larger. Sill bolts shall be placed such that they will not interfere with the full bearing of studs, post, rafters and beams. There shall be no sill splice under any post of mullion. Where notches for pipes etc. exceed 1/3 the width of the sill, place a bolt within 9" of each side of notch. Bolted sills shall be bedded in 1:2 cement mortar

1/2" thick. Do not drypack after sill is in place. b) Blocking and Bridging 2" solid blocking between joist and rafters over supports. 2x3" (min) cross bridging between joists and rafters, not over 8'0" nor more than 8'0" from support. Solid 2" full depth blocking @ plywood joint may be used in lieu of cross bridging. Horizontal solid blocking @ plywood joint shall be placed @ mid-height of study or so spaced that

unbraced length of stud shall not exceed 8'0".

Where joists or stude parallel concrete, fasten with min. 5/8" x 8" bolts on not over 32" o/c unless otherwise shown. Double top plates of exterior walls shall not be cut to lap the top plates of intersecting walls, except @ exterior wall corners or as shown on the drawings. Lag screws shall be screwed (not driven) into place. Drill holes same diameter and depth as shank, then drill holes same diameter as @ base of thread for the threaded portion. Use plate washer as required for same size bolt. Machine bolts shall have a shank diameter within 1/64" of that specified. Bolt holes in wood shall be 1/32" oversize. Pro vide stud cut washers under head end nut where bearing against wood; cut washers under nut where bearing is against steel. Washers will not be required under head of carriage bolts. Length of thread shall be such that not more than 1/2" of thread bears against wood. All nuts shall be tightened when placed and retightened at completion of the job or immediately before closing with finish construction. Bolt holes in wood members, including glulam shall be drilled on the job site. Where steel side plates are used for connection, the plate

shall be used as a template. d) Plywood All plywood sheating used structurally shall extend continuously behind all chalk, tack boards and other finish. When it is to be plastered, plywood shall be protected by an unbroken layer of moisture tight paper.

Plywood joints shall be backed by a single common member. The edge of the plywood sheet shall lap minimum of 3/4" with the backing member. In general, sheets shall be 4'x8'. Use 1987 UBC recommendations for plywood sheets layout at shear walls and roof diaphragms. All horizontal joints shall be backed with 2" solid blocking between studs. Joint backing between rafters shall be 2x4 minimum vertical blocking flush with top of rafter.

e) Minimum Permissible Nailing (Unless shown otherwise on the drawings) Where nails tend to split wood, nail holes shall be subdrilled.

3-8d

NAILING 3-8d CONNECTION Joist to sill or girder, toenail Bridging to joist, toenail each end 1"x6" subfloor or less to each joist, face nail 2-8d2-8d Wider than 1"x6" subfloor to each joist, face nail 3-8d 2" subfloor to joist or girder, blind and face nail 2-16d Sole plate to joist or blocking, face nail 16d • 16" o/c Top plate to stud, end nail 2-16d B. <u></u> —∆¹	TERMINAL BLOCK OR POINT IN STARTER.
	TERMINAL BLOCK OR POINT IN PANEL.
-⊘	SCREW TERMINAL ON A DEVICE.
М	MOTOR STARTER OR RELAY.
-D	MOTOR DISCONNECT SWITCH.

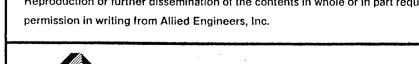

## GENERAL NOTES

- 1. ALL WORK SHALL BE DONE IN COMPLIANCE WITH THE PUBLISHED EDITIONS OF THE NATIONAL ELECTRIC CODE (NFPA 70), 1990.
- 2. ELECTRICAL CONTRACTOR SHALL VERIFY ALL MECH. EQUIPMENT TYPES, MOTOR SIZES, AND CONTROL WIRING REQUIREMENTS WITH MECH. CONTRACTOR, MECH. EQUIPMENT SUPPLIER, OR MANUFACTURER. THE PLANS INDICATE APPROXIMATE LOCATIONS OF ALL MOTORS, INSTRUMENTS AND DEVICES; EXACT LOCATION SHALL BE ESTABLISHED BEFORE CONDUIT IS INSTALLED.
- 3. ALL CONDUIT CONNECTIONS OF FIELD-MOUNTED DEVICES AND MOTORS SHALL BE ACCOMPLISHED WITH APPROPRIATE FLEXIBLE CONDUIT WITH A UNION AT THE END NEAREST THE DEVICE OR MOTOR.
- 4. MINIMUM CONDUIT SIZE SHALL BE 3/4" EXCEPT FOR OVERHEAD RUNS TO LIGHT FIXTURES AND FLEXIBLE CONDUIT, WHICH MAY BE 1/2". EXTERIOR CONDUIT BELOW +8' OR IN EXPOSED LOCATIONS SHALL BE RIGID METALLIC WITH THREADED OR WEATHERPROOF FITTINGS AND CAST METAL J-BOXES.
- 5. ALL CONDUITS ENTERING OR LEAVING THE PROCESS TANKS SHALL BE SEALED USING THE EQUIVALENT OF A CROUSE—HINDS EYS SEAL INSTALLED WITH THREADED CONNECTIONS AND SEALED PER MANUFACTURER'S RECOMMENDATIONS. ALL CONDUIT PENETRATIONS THROUGH CONCRETE SLABS SHALL USE RIGID CONDUIT; COORDINATE LOCATIONS AND INSTALLATION WITH GENERAL AND CONCRETE CONTRACTORS. EXPLOSION—PROOF JUNCTION BOXES SHALL BE USED TO TERMINATE THE SUBMERSIBLE PUMP AND FLOAT—SWITCH CORDS INSIDE THEIR RESPECTIVE TANKS.
- 6. MOUNTING HEIGHTS SHOWN (I.E. +52") ARE FROM FINISHED FLOOR TO NOTED REFERENCE POINT. ALL MOUNTING HEIGHTS SHALL BE AS SHOWN ON SYMBOL LIST UNLESS OTHERWISE NOTED ON DRAWINGS. INSTRUMENT METERS AND DISPLAYS SHALL BE MOUNTED BETWEEN +54" AND 66".
- 7. MINIMUM WIRE SIZES SHALL BE #12AWG FOR POWER CIRCUITS, #14AWG FOR 120V CONTROL CIRCUITS WHICH ARE NOT FUSED, AND #16AWG FOR 24VDC CONTROL CIRCUITS AND 120V CONTROL CIRCUITS FUSED AT 10 AMPS OR LESS. ALL WIRE SHALL BE STRANDED COPPER AND A GROUND WIRE SHALL BE RUN IN ALL POWER CONDUITS. WIRES FOR 24VDC CIRCUITS SHALL BE RUN IN SEPARATE CONDUITS FROM WIRES FOR AC POWER OR CONTROL CIRCUITS.
- 8. CIRCUIT BREAKERS MARKED WITH AN "L" SHALL HAVE A LOCKING ADAPTER WHICH WILL ALLOW THE BREAKER TO BE PADLOCKED IN THE OFF POSITION, OR THE PANEL DOOR OF THE RESPECTIVE PANEL SHALL BE LOCKABLE.
